

Remote Job Market Intelligence

A two-page BI dashboard tracking 215 remote job listings across the US, UK, Germany and the Netherlands

Project report — September 2026

Project Overview

This project builds an end-to-end pipeline and BI dashboard that tracks where remote-friendly jobs are opening, which skills employers are asking for, and how compensation compares across markets. A Python script pulls live listings from two free job-board APIs, cleans and normalizes them, and pushes the result into Google Sheets, which feeds a two-page Looker Studio dashboard.

Roles tracked	215
Companies represented	67
Job categories	29
Listings with salary data	102 (47%)
Markets covered	US, GB, DE, NL, plus worldwide/multi-region listings
Data sources	Remote API, Adzuna API

Page 1 — Overview

Figure 1. Overview page — KPI summary, category breakdown, posting trend, skills demand, and recent listings.

KPI row

Four scorecards set the scope at a glance: 215 total roles tracked, 67 companies represented, 29 distinct job categories, and 102 listings (47%) that included usable salary data.

Top Job Categories

A horizontal bar chart of the most common categories across both sources. “Uncategorized” and “IT Jobs” lead the pull, followed by Healthcare & Nursing and Admin roles. Categories from the German and Dutch Adzuna results (e.g. teaching, sales, accounting) were kept in their original language rather than force-translated, since that’s what the source data actually returned.

Postings Over Time

A monthly trend line of when listings were originally posted. Activity is heavily concentrated in recent months, with two older spikes (2019, 2021) coming from long-running agency listings still active on Adzuna rather than genuinely new postings — a data-quality nuance worth flagging rather than smoothing over.

Skills in Demand

Skill mentions extracted from job titles and descriptions using keyword matching. Go, Java, and Machine Learning top the list, with React, JavaScript, Python, and TypeScript close behind — a reasonably even spread across backend, frontend, and data roles rather than dominance by a single stack.

Recent Listings

A sortable, paginated table of individual postings — title, company, category, country and a direct link to each listing — for anyone who wants to drill into the raw data behind the charts above.

Page 2 — Compensation & Companies

Figure 2. Compensation & Companies page — location coverage, employment type, salary by market, and top hiring companies.

Location Coverage

NL, US, GB and DE each contribute 50 listings by design (the Adzuna pull was capped per market), with a long tail of broader Remoteive listings tagged Worldwide, LATAM, Americas, or Europe.

Employment Type Mix

Most listings (152 of 215) simply don't specify an employment type in the source data — shown honestly rather than hidden. Of the ones that do, part-time listings outnumber full-time, with a small share of freelance and contract roles.

Salary by Market

Average reported minimum salary, kept separate by country rather than blended into one number — US (\$66,857), GB (£31,539), and NL (€35,352, though only 2 listings, too few to generalize from) are in different currencies and aren't directly comparable. DE listings in this pull didn't include salary data at all, shown as “No data” rather than a misleading zero.

Top Hiring Companies

A ranked table of the companies posting the most listings in this pull — led by Appen (36), Apex Focus Group (22), and Apprentus (21), mostly reflecting recruitment- and BPO-style employers that post in volume.

Methodology & Tech Stack

The pipeline is a single Python script that queries both APIs, normalizes the results into one schema, extracts a fixed list of tech-skill keywords from each listing's title and description, and exports two CSVs — one row per job, and one row per (job, skill) match.

Extraction	Python (requests) — Remote API, Adzuna API
Transformation	Python (pandas) — schema normalization, skill-keyword extraction
Storage	Google Sheets
Visualization	Looker Studio — responsive, 2-page report

Key Insights

- US listings report meaningfully higher minimum salaries than GB in this sample — though currencies differ, so this reflects market scale more than a like-for-like comparison.
- Nearly half of all listings (47%) disclose no salary information at all, and 71% don't specify an employment type — a real transparency gap in how remote roles get posted.
- Go and Java lead the skills list ahead of the more commonly assumed Python/JavaScript pairing, at least within this pull's mix of sources and categories.
- A handful of high-volume posters (Appen, Apex Focus Group, Apprentus) account for a disproportionate share of listings, suggesting the market is partly shaped by a few large, repeat recruiters rather than being evenly spread across employers.
